Uncommon Eye Injury in Autistic Children Has Common Cause
Study Shows Therapeutic Swings for Autism-Spectrum Disorder Patients Pose Danger

Philadelphia, PA, April 5, 2010 – The presence of metallic foreign bodies in the eye is an uncommon injury in children, so much so that two children with autism presenting with this injury led to detective work by two physicians that found the common cause. An article published in the current issue of the Journal of AAPOS, the Official Publication of the American Association of Pediatric Ophthalmology and Strabismus, documents how a physician from Technion-Israel Institute of Technology and Bnei-Zion Medical Center, Haifa, Israel; and another from the Cincinnati Children’s Hospital Medical Center (CCHMC), Cincinnati, OH, discovered that therapeutic swings, commonly used for patients with autism-spectrum disorders, were shedding metallic particles directly into the eyes of the children.

The first patient, an 8-year-old boy, was found to have a corneal metallic foreign body in the right cornea. Previously he had had a corneal metallic foreign body removed by another physician. A meticulous history of the child’s activities, taken after this recurrence, revealed that the child spent hours each day on a home therapeutic swing with metallic suspensions.

A 10-year-old boy presented with a similar metallic foreign body in his eye. In this case, the patient had suffered from 3 similar events in the past 3 years. The mechanism of the prior recurrent foreign bodies was not initially understood. This time, in light of the first case, the patient’s family was specifically asked about the use of a therapy swing. The family reported on the patient’s extensive use of a homemade swing with metallic suspensions. The family was advised to fix the suspension and have the child use protective eyewear during swing use. There were no recurrences.
Although corneal sensation is usually intact, children with disabilities may have difficulties communicating and complaining about foreign body sensation, with resulting delay in diagnosis. In addition, due to poor cooperation in children, and in particular children with disabilities, examination and foreign body removal often necessitate general anesthesia.

According to author Dean J. Bonsall, MD, Cincinnati Children’s Hospital Medical Center and Associate Professor, University of Cincinnati College of Medicine, "Raising awareness of this potential source of eye injury in children with autism is paramount. This type of injury is easily preventable by wearing protective eye wear or modifying the swing apparatus."

Editor-in-Chief, JAAPPOS, David G. Hunter, MD, PhD, adds, "It is important for parents to know that some swing designs that place a metal mechanism over the child's face could result in tiny pieces of metal falling into their child's eye. Drs. Kehat and Bonsall did some excellent detective work to make this discovery. These are not trivial injuries – metallic foreign bodies can lead to corneal scarring, and in one of their cases it required general anesthesia to remove the metal."

The article is “Recurrent corneal metallic foreign bodies in children with autism spectrum disorders” by Rinat Kehat, MD, PhD and Dean J. Bonsall, MD, MS. The article appears in the Journal of AAPOS, December 2009 (Volume 13, Issue 6, Pages 621-622) published by Elsevier.

ABOUT JOURNAL OF AAPOS (http://www.journals.elsevierhealth.com/periodicals/ympa)

Journal of AAPOS presents expert information on children's eye diseases and on strabismus as it impacts all age groups. Major articles by leading experts in the field cover clinical and investigative studies, treatments, case reports, surgical techniques, descriptions of instrumentation, current concept reviews and new diagnostic techniques. The Journal is the official publication of the American Association for Pediatric Ophthalmology and Strabismus.

ABOUT THE AMERICAN ASSOCIATION FOR PEDIATRIC OPHTHALMOLOGY AND STRABISMUS (www.aapos.org)

The goals of the AAPOS, the American Association for Pediatric Ophthalmology and Strabismus are to advance the quality of children's eye care, support the training of pediatric ophthalmologists, support research activities in pediatric ophthalmology and advance the care of adults with strabismus.

ABOUT ELSEVIER

Elsevier is a world-leading publisher of scientific, technical and medical information products and services. The company works in partnership with the global science and health communities to publish more than 2,000 journals, including The Lancet (www.thelancet.com) and Cell (www.cell.com), and close to 20,000 book titles, including major reference works from Mosby and Saunders. Elsevier's online solutions include ScienceDirect (www.sciencedirect.com), Scopus (www.scopus.com), Reaxys (www.reaxys.com), MD Consult (www.mdconsult.com) and Nursing Consult (www.nursingconsult.com), which enhance the productivity of science and health professionals, and the SciVal suite (www.scival.com) and MEDai's Pinpoint Review (www.medai.com), which help research and health care institutions deliver better outcomes more cost-effectively.

A global business headquartered in Amsterdam, Elsevier (www.elsevier.com) employs 7,000 people worldwide. The company is part of Reed Elsevier Group PLC (www.reedelsevier.com), a world-leading publisher and information provider, which is jointly owned by Reed Elsevier PLC and Reed Elsevier NV. The ticker symbols are REN (Euronext Amsterdam), REL (London Stock Exchange), RUK and ENL (New York Stock Exchange).
